The Natural Textiles collection features natural and environmentally responsible products. Products found in the offering are constructed of natural textiles, silks, and wood pulp compositions.

1. **Cyclical** – The materials used in the MDC Natural Textiles collection are mainly compostable organic materials such as linen, cotton, silk, viscose, sisal, and wood pulp. Chemical fibers are only used if there, at this moment, are no alternatives in natural materials.
2. **Renewable Energy** – The manufacturing facility producing MDC Naturals uses only wind and hydro energy.
3. **Eco Friendly** – All manufacturing processes such as dying, printing, lamination, finishing, etc. are all completely waterbased. The waste is recycled as much as possible and the remaining waste is disposed of through a professional waste management company.
4. **Efficient** – Through constant monitoring and improvement, the mill is committed to using less material, energy, and natural resources. For instance, the water used during manufacturing is collected as much as possible from rainwater. This now represents 65% of the plant's total water consumption.
